APPLYING RESEARCH TO A REALIZED THEATRICAL DESIGN

Kathalina Thorpe Faculty Sponsor: Professor Ruth Brandvik

College of the Arts Art & Design, Communication, and Music

Abstract:

When analyzing a theatrical performance many outside

eyes do not see the level of research and research

Introduction:

"All aspects of a scenic designer's work can be approached

as craft. The challenge is to recognize the importance of the

decisions that need to be made. Even the most intangible,

can be approached with craft. The study of the text,

research, and conceptual thinking are skills best practiced

and mastered with planning thoroughness, and purpose."-

Robert Klingelhoefer.

For the production of Truth and Other Lies this February I

had to work with both the tangible and intangible parts of

the craft. I was able to utilize trial and error approaches to

many design elements while still holding on to research

elements and director values. The importance of sharing this

process is to show how much deeper the art of Theater

goes. It is not a simple create and perform process. There

are countless hours of research and "elegant solutions" to

be had. This poster is designed to give a tangible breakdown

and understanding of this process through scenic models,

renderings, image research, and photos of the realized

production.

application that happens to generate the finished -Group Discussions: Give the "Wh" questions product. Through this educational poster the presenter shows that research is not only a staple of the generation of all theatrical designs but shows that when applied with thoughtful execution said research enhances and magnifies the design and the over all final product: the live performance. asked to begin designs before that are

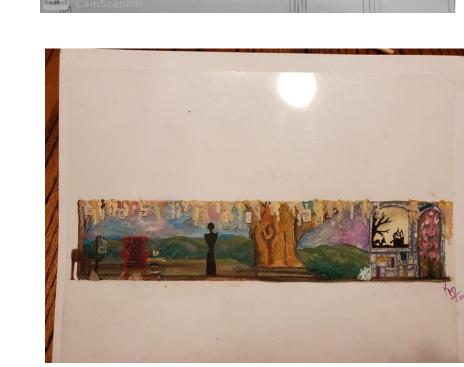

> -Story Boarding and Image Research: With the early research for design processes the first thing you look for is a concept and that first image or set of images will guide the kind of inspiration that you look for. With the use of myths and legends some of the sources most valuable to the designer are primary and secondary source art works. Once the concept is established hours or research for images to

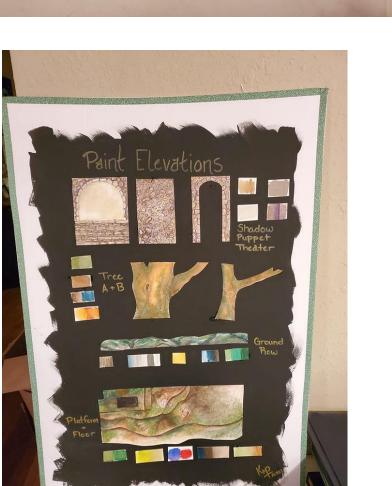

> -Thumbnail Sketches: Before ever putting a pencil to sketch pad the designer also does research on scale, perspective and the space in which they are drawing their scenery in. That information can come from drafting's of the space and the technical director.

> -The Design Presentation: The designer needs to do research on their audience and on how to appeal to the crowd and sell the concept. At this point everything is just an idea and the team needs to be sold on the vision. There is a lot of leg work that goes in to making a sales pitch and laying out an appealing presentation.

- -Drafting Ground Plans of Platforming: Requires research of regulations on the industry standards for height and depth of steps and attending rehearsals to see how the cast hopes to use the space you are designing for them.
- -After the Appearance of the Script: The team will meet again for design revisions and the research that goes in to putting the polish on the scenery is looking at each character in the script and each location and dissecting that information and applying the primary and secondary image research to additional sketches and renderings for the director so that the designer can complete the drafting's for the technical director and create a scale model and paint elevations for the rest of the team to reference.

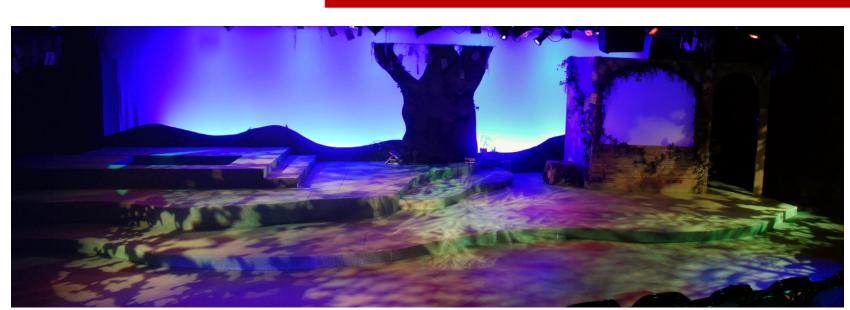

-The Final Design Package: The designer presents a final package that is a culmination of their research on the design for a show so that lighting, costumes, and the technical director can build the show without having to have the designer constantly on call. To do that the execution and composition of that research is what takes an idea to the next level of the design. The more thorough the research the higher the art of the show. The designer will hand off the placement of set dressing and furniture as well as how it looks and what time period its set in. They give painters the color information on what the set should be painted like and in that they will share additional information like textures or unique features like bark or brick. They also share information on the intended use of the set pieces.

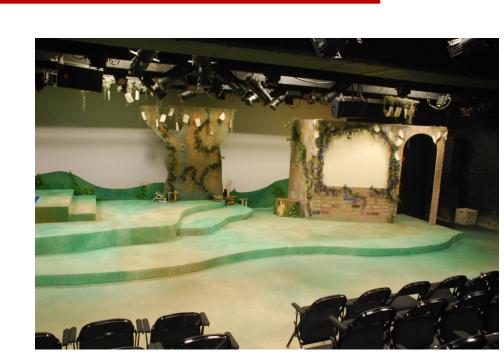

Results:

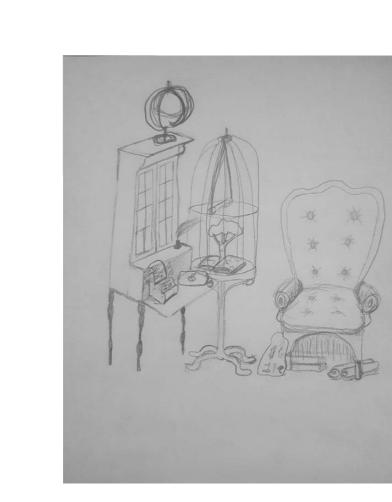

Conclusion:

Though Scenic Design does not look like it requires research because not everything is quantitative or analytical when you view the finished product the nuances shown in the step by step break down of the design process shows that there is indeed a great deal of research in various topics to create the final product: The Staged Performance.

Research Process:

so that the designer has a place to begin their research and in a devised theater piece this is integral to building all elements of the world in which the play happens. This is also unique because designers of devised pieces may be presented a script.

create a story board commences.
